### Final Proposal

As gas prices skyrocketed across the country these past few months, so has the conversation surrounding electric vehicles (EVs). Congress recently passed the 1.7 trillion-dollar infrastructure bill, with nearly 7.5 billion of it allocated towards building out America's EV charging network. With this increased buzz surrounding EVs, there is still a lot of hesitation and varied opinion about EV adoption nationwide.

This project hopes to explore how EV sentiments have changed over time in the U.S., while also analyzing spatially, how benchmark policies have influenced California EV adoption rates.

With interactive charts, maps, and dashboard we hope to visualize the change of EV sentiments more broadly, then explore more granularly, California's EV adoption and policy with a comparative analysis (pre & post EV Policy) lens.
